AMENDMENTS TO THE CLAIMS

1.-4. (Canceled)

- 5. (Original) A method of identifying whether a protein is susceptible to forming amyloid, the method comprising analyzing the amino acid sequence of the protein to determine whether the protein contains a predicted discordant helix, wherein the presence of predicted discordant helix is an indication that the protein is susceptible to forming amyloid.
- 6. (Original) The method of claim 5, wherein the discordant helix is at least six amino acids in length.
- 7. (Original) A method of decreasing the rate of formation of β -strand structures between at least two discordant helix-containing polypeptides, the method comprising contacting the discordant helix-containing polypeptides with a compound that stabilizes an α -helical form of the discordant helix.
- 8. (Original) A method of treating an individual having or at risk for an amyloidosis, the method comprising administering to the individual a therapeutically effective amount of a compound that stabilizes an α -helical form of a discordant helix-containing polypeptide that forms amyloid.
- 9. (Original) The method of claim 8, wherein the amyloidosis is selected from the group consisting of prion diseases and Alzheimer's disease.
